

For the first paragraph I want to say that I have 10 fingers. That is just a simple integer number with no commas and no units so it should be easier to detect.

For the second paragraph I want to say that I have a crisp new \$50 bill in my wallet. This number contains a symbol that should make it clear it is currency.

For the third paragraph I want to test the parsing of a very large number so I am including a number that has a comma in it. That number is 10,000 . This is a test of large numbers with commas.
